

# Next Generation Sequencing As a Tool in Foodborne Disease Surveillance And Outbreak Investigation – Challenges and Opportunities

Peter Gerner-Smidt, MD, DSc  
Branch Chief

SCIENCE • FOOD • SOCIETY

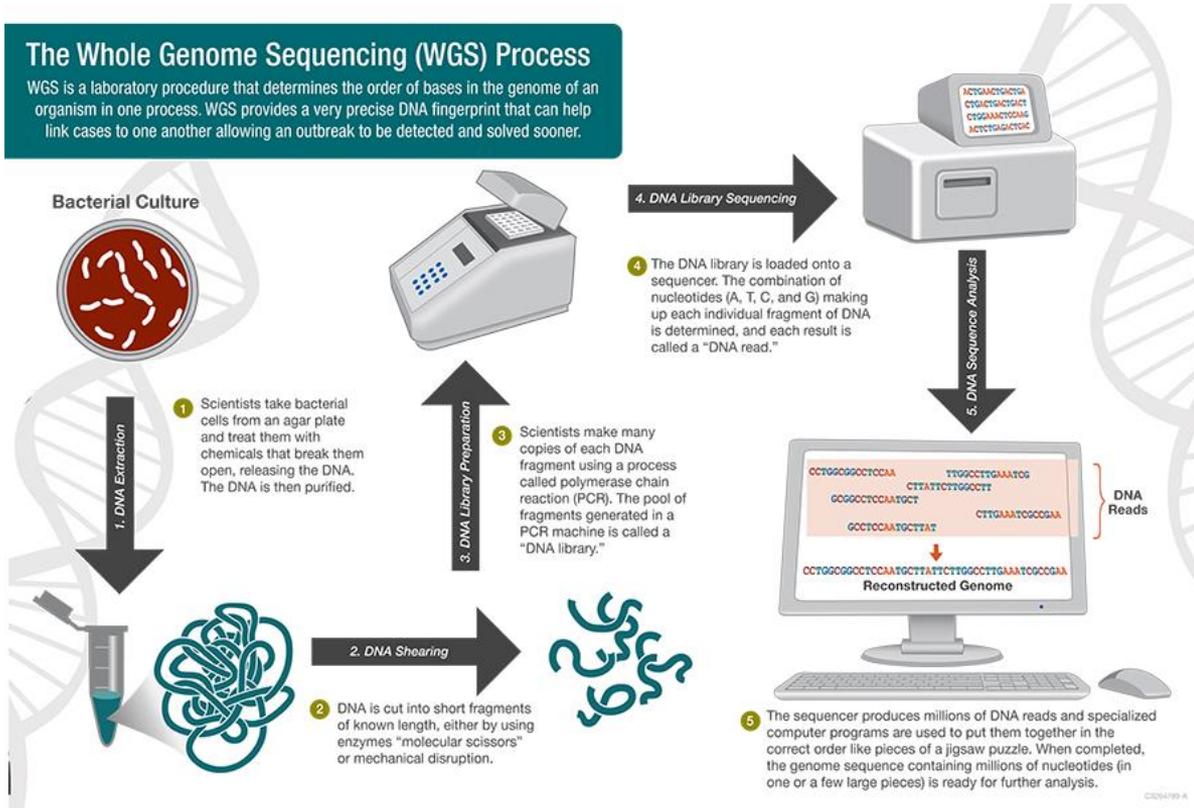

Parma - Italy, 18-21 September 2018

# Next Generation Sequencing (NGS) ~ Whole Genome Sequencing (WGS)

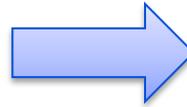

## The Whole Genome Sequencing (WGS) Process

WGS is a laboratory procedure that determines the order of bases in the genome of an organism in one process. WGS provides a very precise DNA fingerprint that can help link cases to one another allowing an outbreak to be detected and solved sooner.

# Why The Hype About WGS?

- WGS is transforming microbiology, replacing numerous traditional methods with one in a single efficient workflow  
Identification – Serotyping – Virulence profiling – Resistance profiling – Subtyping – and much more

# Reference Characterization by WGS: 'One Shot' Characterization Of STEC

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Public Health Service

Centers for Disease Control  
and Prevention (CDC)  
Atlanta GA 30333

**Genus/Species:** *Escherichia coli*

**Serotype:** O104:H4

**Pathotype:** Shiga toxin-producing and enteroaggregative *E. coli* (STEC/EAEC)

**Virulence profile:** *stx2a, aqqR, aqqA, sigA, sepA, pic, aatA, aaiC, aap*

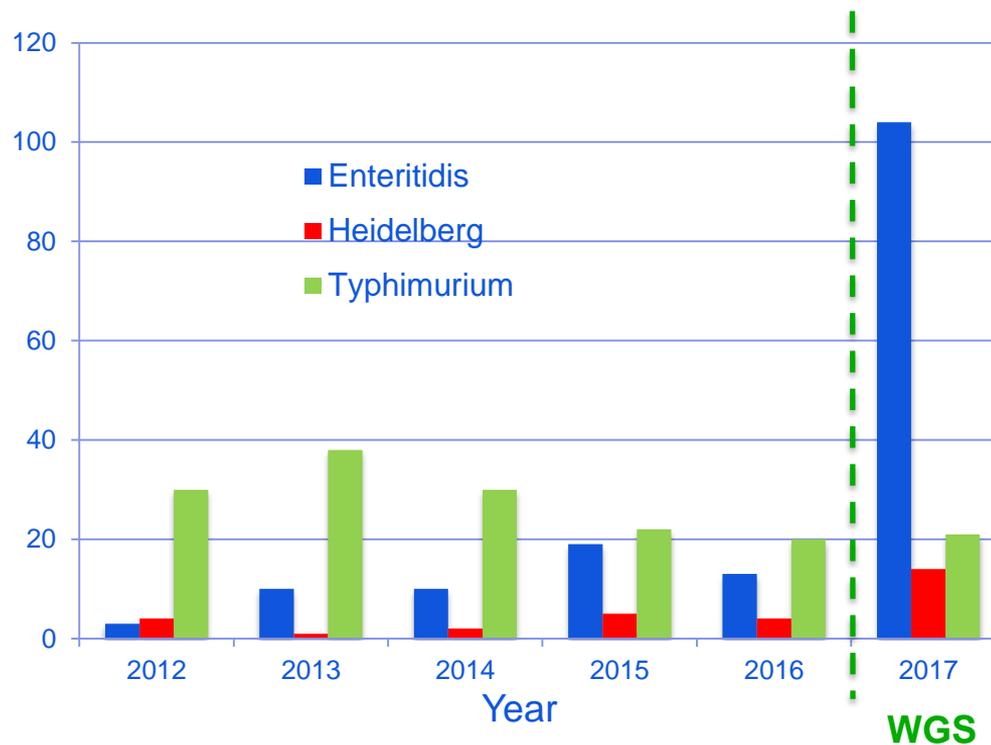

**Sequence Type:** ST678

**Allele code:** 102.45.26.35.3

**Antimicrobial resistance genes:** *bla*<sub>TEM-1</sub>, *bla*<sub>CTX-M-15</sub>, *strAB, sul2, tet(A)A, dfrA7*

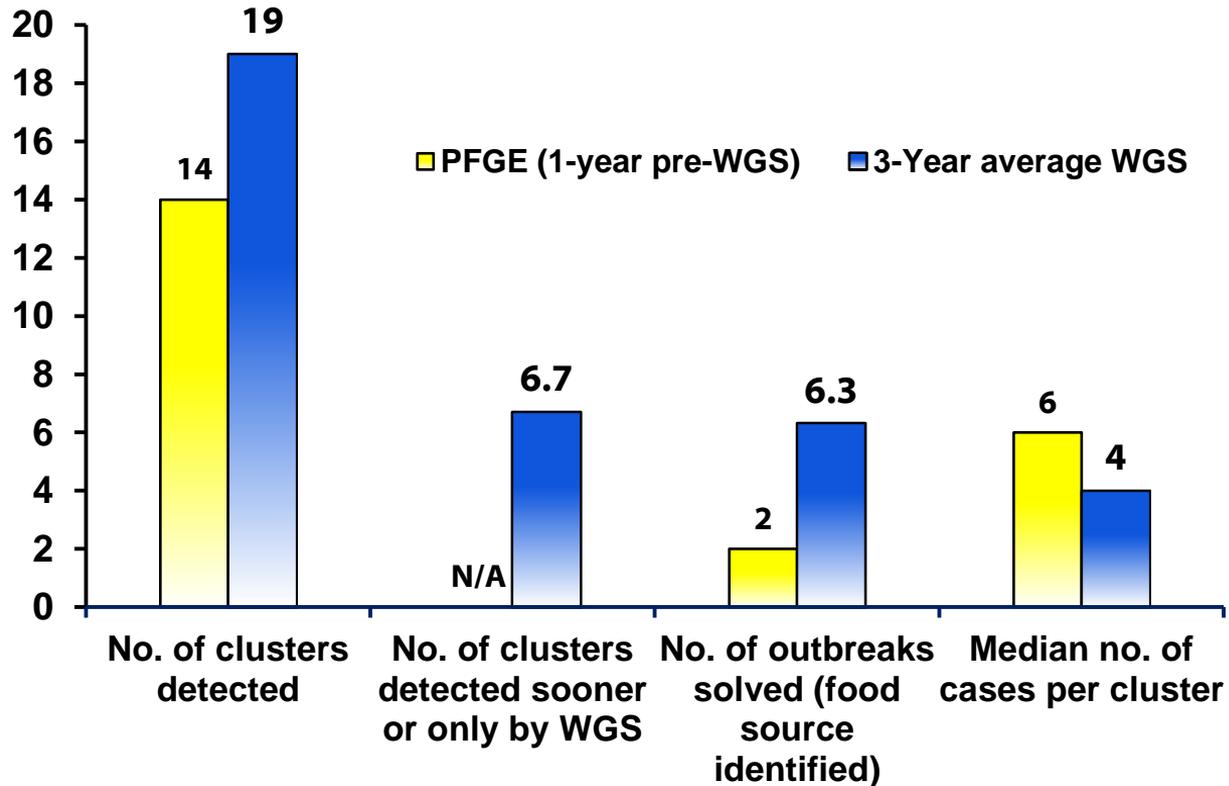

# Salmonella outbreaks in Canada

Number of Salmonella outbreaks detected with laboratory data

# Real-time WGS Improves Laboratory Surveillance

## *Listeria* Metrics

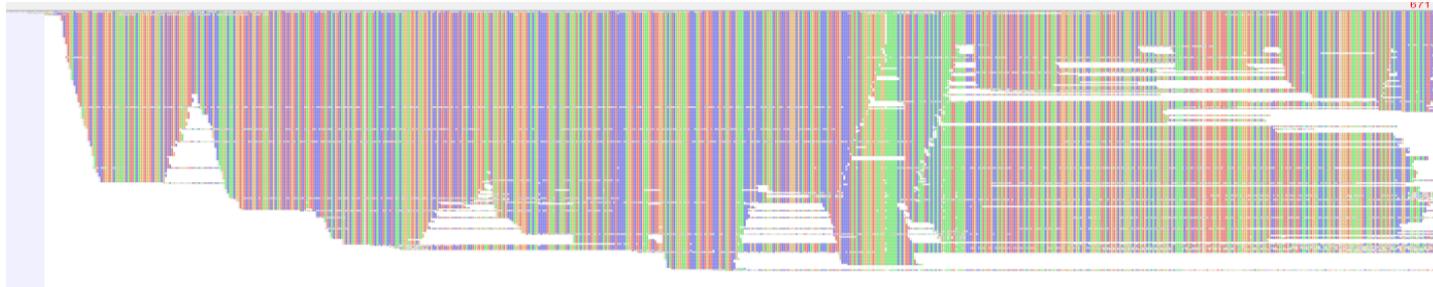

# How WGS Influence Outbreak Investigations

- **Improved case definitions in outbreaks**
  - Apparent PFGE clusters are not single-source outbreaks or are pseudo-clusters
  - Isolates with same PFGE patterns may be unrelated
  - Isolates with different PFGE patterns may be related
- **Increase confidence in the link between human and product isolates**
- **Link historical cases to a current outbreak investigation**
- **Characterize the ecology of long-term pathogen reservoirs in the food chain**

# The Basics of WGS

- “Massive parallel sequencing”
- The whole genome sequenced in small random pieces (‘shotgun sequencing’, 25- >1000 bp) multiple times (‘coverage’)
- Four major & different sequence technologies
  - Each with different strengths and weaknesses
- ‘Coverage’ usually 20- several 100 X

# The Basics of WGS

- Assembling and annotating the sequence
  - Solving the puzzle using an 'assembler' software

'Reference -Based Assembly

'de novo Assembly'

- Assembled in 1- 200 (- 500) fragments ('contigs')
- MANY DIFFERENT ASSEMBLY SOFTWARES- None are perfect
- Each make different errors

# Two High-Discrimination Analytical Approaches

- Nucleotide level analysis
  - Single Nucleotide Polymorphisms (SNPs)
  - ‘Like assessing all the letters in a book’
    - Difficult to standardize between laboratories
- Gene level
  - Multi-Locus Sequence Typing (MLST, cg/wgMLST)
  - ‘Like assessing all the words in a book’
    - Can be standardized between laboratories
- Many different pipelines and schemes for sequence analysis
  - No two pipelines provide the exact same results!
    - Results generated by different pipelines can NOT directly be compared
  - But each generates **reproducible results**

# Quality control – quality control – QUALITY CONTROL

- **Assuring WGS quality within one institution is fairly easy**
  - **WGS works very well for national surveillance with centralized analysis**
- **No international quality standards exist**
- **No international consensus on the use of specific pipelines**

# What About Global Surveillance of Foodborne Infections?

- ❑ **A foodborne infection on one continent may have its source on a different continent**
- ❑ **International outbreaks are common**

## Pathogen Detection BETA

View the recent webinar: '[Introducing the Pathogen Detection Isolates Browser](#)'.

NCBI Pathogen Detection integrates bacterial pathogen genomic sequences originating in food, environmental sources, and patients. It quickly clusters and identifies related sequences to uncover potential food contamination sources, helping public health scientists investigate foodborne disease outbreaks.

[Find isolates now!](#)

Examples:

1. Search for isolates encoding a mobile colistin resistance gene and a KPC beta-lactamase search: [AMR\\_genotypes:mcr\\* AND AMR\\_genotypes:blaKPC\\*](#)
2. Search for Salmonella isolates from the USA search: [geo\\_loc\\_name:USA AND taxgroup\\_name:"Salmonella enterica"](#)

# WGS for Foodborne Disease Surveillance in The Global Context

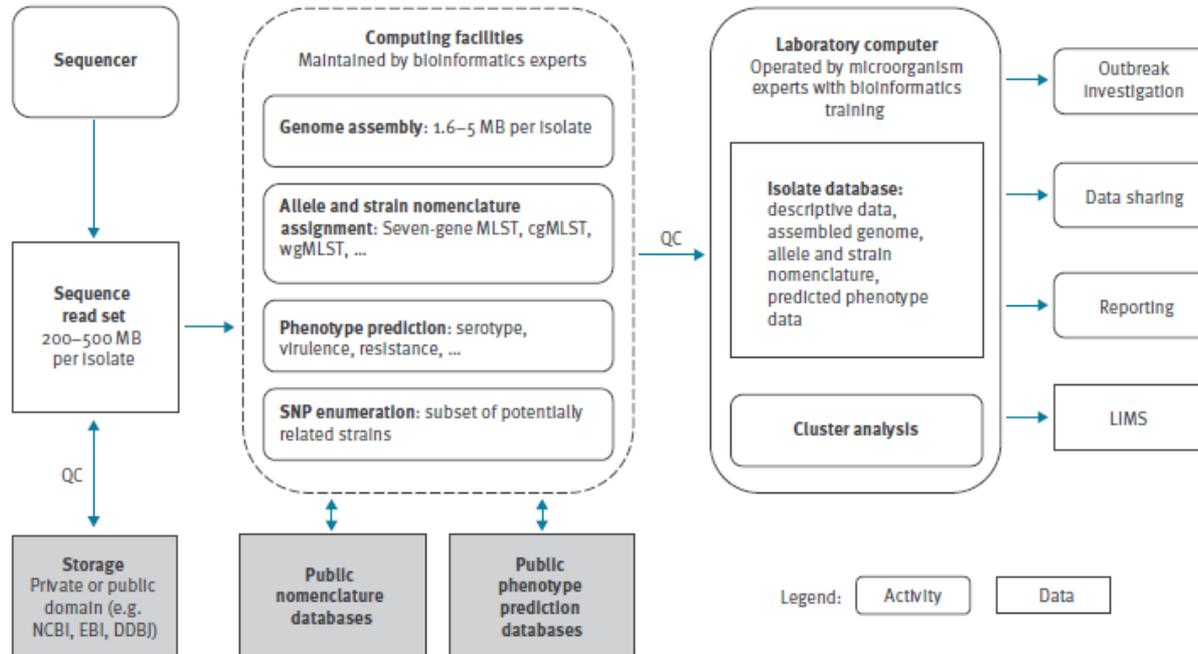

**Fast, precise, simple communication and easy sharing of data is key in outbreak investigations**

- **Standardized/harmonized and validated generation of results**
- **Results in standardized format**
- **Low volume format**
  - **to accommodate slow internet speeds**
  - **no need to go back to raw data**
- **Solutions must be PRACTICAL and NOT necessarily PERFECT**  
**'If it works, it is good enough'**

# International Standardization and Harmonization Of WGS For Surveillance Of Foodborne Pathogens

## The PulseNet Model

Nadon C, Van Walle I, *et al.* PulseNet International: Vision for the implementation of whole genome sequencing (WGS) for global food-borne disease surveillance. *Euro Surveill.* 2017;22(23):pii=30544. DOI: <http://dx.doi.org/10.2807/1560-7917.ES.2017.22.23.30544>

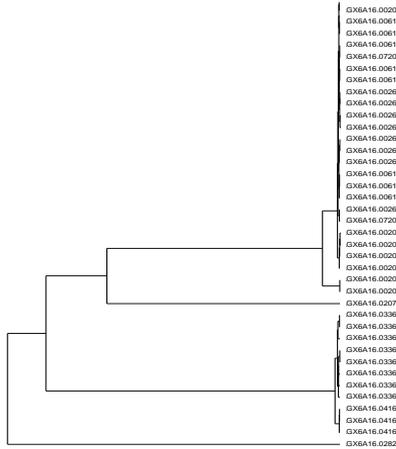

# The Challenge of Data Interpretation

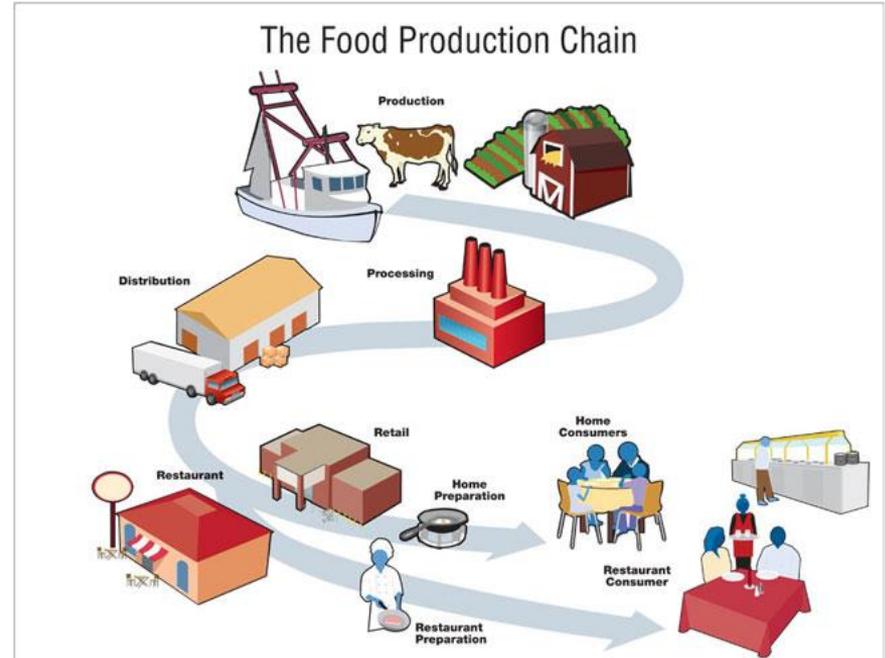

# With WGS, How Close Is Close?

- No isolates 100% identical
- WGS data are contiguous

- Epidemiological data and other metadata more critical than ever for WGS data interpretation

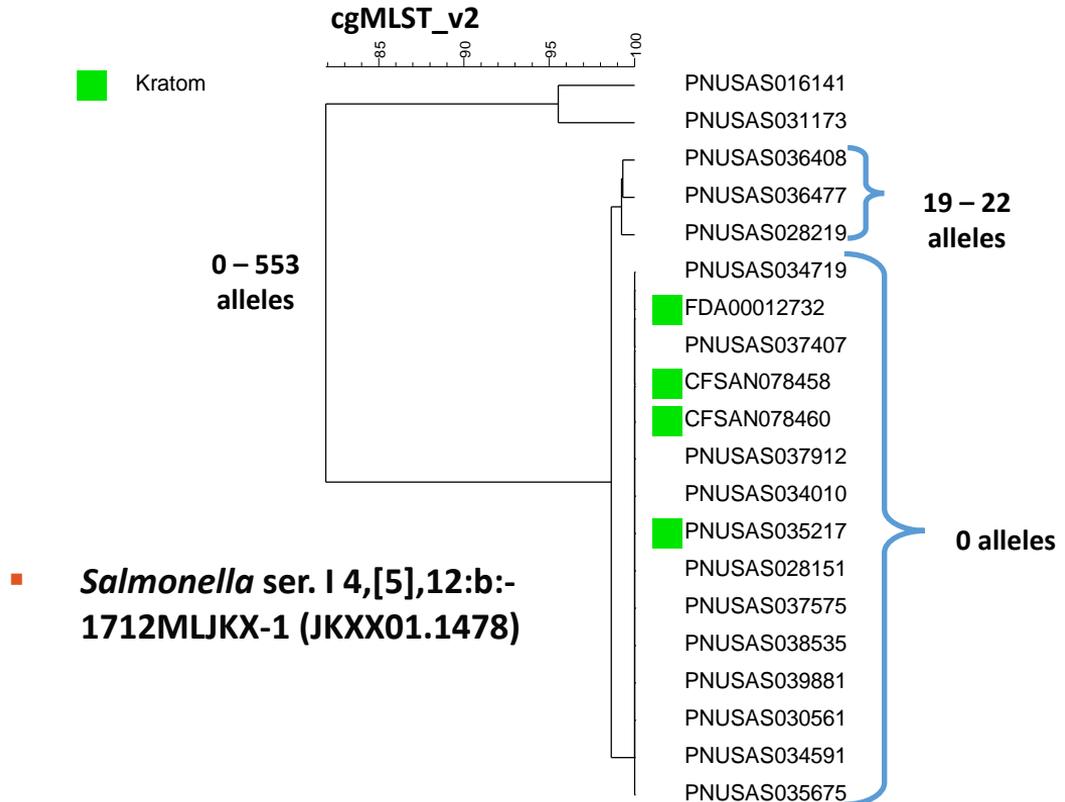

# Salmonella Outbreak Associated with Kratom Consumption/Use in the U.S. 2018

- ~ 200 cases
- 6 serotypes:
  - **I 4,[5],12:b:-**
  - Thompson
  - **Okatie**
  - Javiana
  - Heidelberg
  - Weltevreden

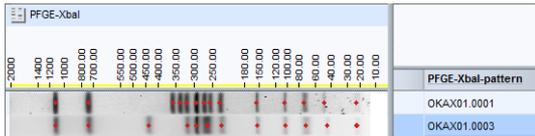

**Kratom**, Thang, Kakuum, Thom, Ketom, and Biak

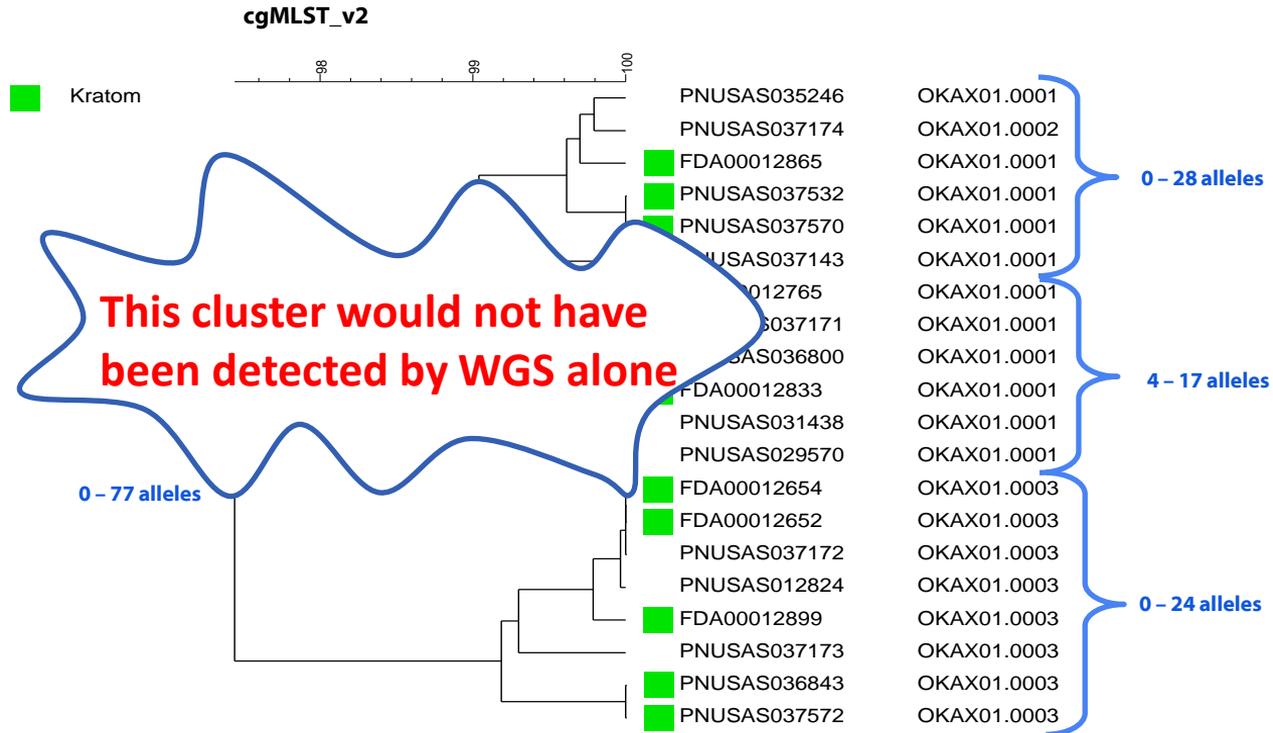

# Salmonella Outbreak Associated with Kratom Consumption/Use in the U.S. 2018

*Salmonella* ser. Okatie  
OKAX01.0001, OKAX01.0003

**Kratom, Thang, Kakuum, Thom, Ketom, and Biak**

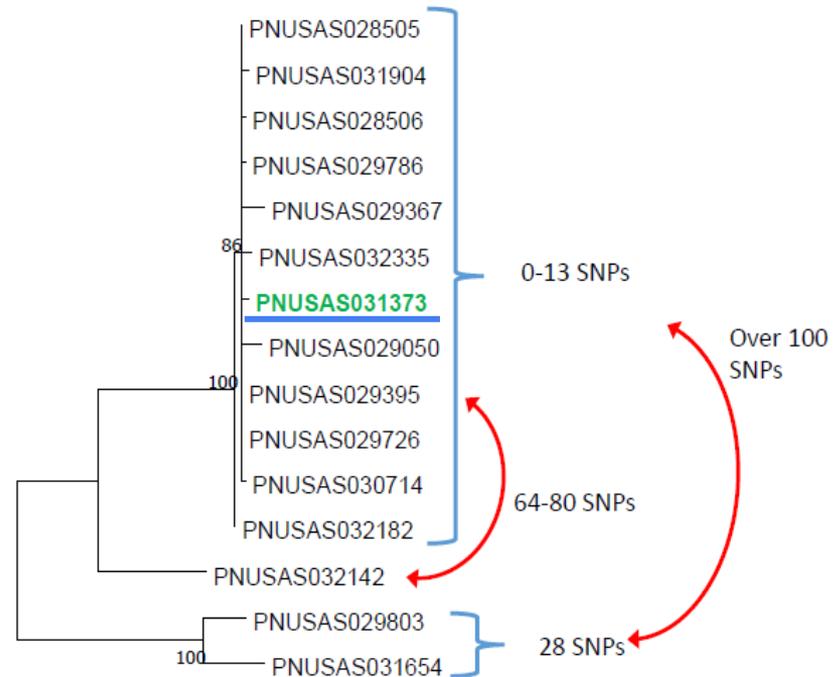

# Don't let the WGS data fool you!

## All supporting information must always be considered

*Salmonella* ser. Typhimurium strain from Egg Nog clustering with isolates from outbreak associated with laboratory exposure, 2017

## Outbreak of Salmonella Agona infections linked to internationally distributed infant formula

December 4, 2017

### Event introduction

**Update 7 February 2018:**

A retrospective analysis using genomic sequencing at the National Reference Centre for Salmonella at the Institut Pasteur in France has confirmed that the strain involved in this outbreak is the same strain that was responsible for a similar outbreak caused by infant formula produced in the same plant in 2005. The 2005 event was reported through INFOSAN at that time and can be referred to on the INFOSAN Community Website, [here](#).

In addition, analysis using genomic sequencing at the National Reference Centre for Salmonella at the Institut Pasteur in France has also been able to identify 27 additional cases of *S. Agona* from the period 2006-2016, exclusively in infants. These 27 retrospectively identified cases have occurred over a period of several years, with no grouping of cases over time or in a specific region. Additional information on these findings is available on the Santé Publique France website, [here](#).

INFOSAN members in countries that have imported Lactalis products from the Craon factory since 2005 may consider: 1) reviewing their retrospective surveillance data for cases of infants infected with *S. Agona*; and 2) genomic sequencing of isolates if cultures are still available. Performing such analysis would allow for comparison with the outbreak in France and would help to characterize the global significance of this event. WHO Collaborating Centres may also be available to conduct such analyses. Please contact the INFOSAN Secretariat if you require support in this regard.

JOINT ECDC-EFSA RAPID OUTBREAK ASSESSMENT

Multi-country outbreak of *Listeria monocytogenes* serogroup IV<sub>b</sub>, multi-locus sequence type 6, infections linked to frozen corn and possibly to other frozen vegetables — first update

3 July 2018

# The Challenge of Data Sharing

- **WGS data should be publicly available in real time**
  - SRA, ENA and the DNA Data Bank of Japan
  - Minimum epidemiological data – time, place and type of isolate
- **Barriers**
  - Ethics: Personal identifiable information
  - Intellectual property and other legal issues
- **Food industry concerns**
  - No “statute-of-limitations” on liability
  - No precise definition of “outbreak”
  - No international interpretation standards ⇒ misinterpretation of data
  - Trade implications

# WGS: Concerns Remaining

- **WGS turnaround time issues**
  - Still long (~ 7 work days)
- **Cost**
- **Cluster triage**
  - Not resources to investigate all outbreaks
  - Which should be investigated?
- **Culture-independent diagnostic testing (CIDT)**
  - We are losing the isolates!

# Coming Soon: Big Data to Improve Food Safety

- **Pathogen characterization direct-from-specimen (faster) - Metagenomics**
- **Linking data from different sources, incl. non-lab data = More information to inform policy**

## **But**

- **Privacy issues**
- **Regulatory hurdles**
- **Data capacity issues**
